Q1. How many different candy types are in this dataset?

```
nrow(candy)
```

[1] 85

Q2. How many fruity candy types are in the dataset?

```
sum(candy$fruity)
[1] 38
##Favorite Candies
     Q3. What is your favorite candy in the dataset and what is it's winpercent value?
  candy["Twix", ]$winpercent
[1] 81.64291
  candy["3 Musketeers", ]$winpercent
[1] 67.60294
     Q4. What is the winpercent value for "Kit Kat"?
  candy["Kit Kat", ]$winpercent
[1] 76.7686
     Q5. What is the winpercent value for "Tootsie Roll Snack Bars"?
  candy["Tootsie Roll Snack Bars", ]$winpercent
[1] 49.6535
  library("skimr")
  skim(candy)
```

Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset? yes, the winpercent

Q7. What do you think a zero and one represent for the candycolor 2 whether its chocolate or not

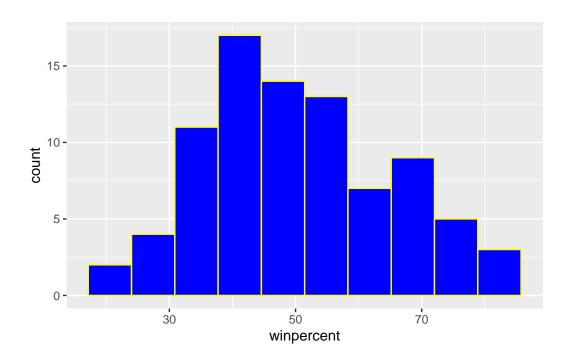

Q8. Plot a histogram of winpercent values

hist(candy\$winpercent)

## Histogram of candy\$winpercent

```
library(ggplot2)
ggplot(candy)+
  aes(winpercent)+
  geom_histogram(bins=10, col="yellow", fill="blue")
```

Q9. Is the distribution of winpercent values symmetrical? no the distribution is not symmetrical

Q10. Is the center of the distribution above or below 50%? below 50%

Q11. On average is chocolate candy higher or lower ranked than fruit candy?

```
chocolate.inds <- as.logical(candy$chocolate)
chocolate.wins <- candy[chocolate.inds,]$winpercent
chocolate.wins</pre>
```

```

  #Average Fruity
  mean(fruit.wins)
[1] 44.11974
     On average, chocolate is ranked higher than fruit candy.
     Q12. Is this difference statistically significant?
Yes it is significant since p-value = 2.871e-08
  t.test(chocolate.wins, fruit.wins)
    Welch Two Sample t-test
data: chocolate.wins and fruit.wins
t = 6.2582, df = 68.882, p-value = 2.871e-08
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
11.44563 22.15795
sample estimates:
mean of x mean of y
60.92153 44.11974
     Q13. What are the five least liked candy types in this set?
  head(candy[order(candy$winpercent),], n=5)
```

##Overall Candy Rankings >Q15. Make a first barplot of candy ranking based on winpercent values.

```
library(ggplot2)

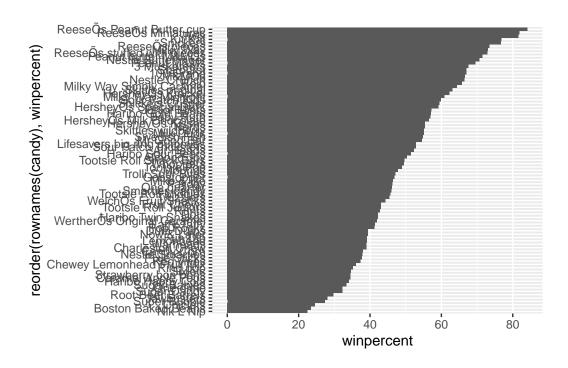

ggplot(candy) +
  aes(winpercent, rownames(candy)) +
  geom_col()
```

Q16. This is quite ugly, use the reorder() function to get the bars sorted by winpercent?

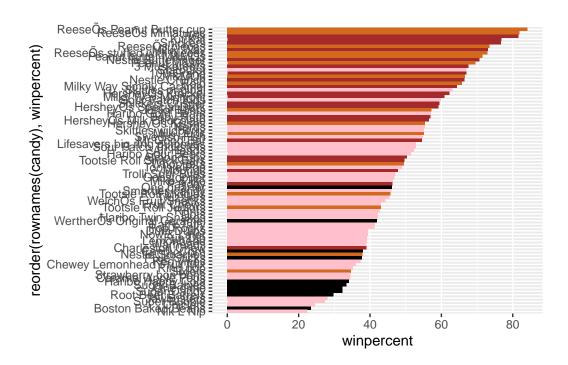

```
library(ggplot2)

ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent)) +
  geom_col()
```

```
my_cols=rep("black", nrow(candy))
my_cols[as.logical(candy$chocolate)] = "chocolate"
my_cols[as.logical(candy$bar)] = "brown"
my_cols[as.logical(candy$fruity)] = "pink"

ggplot(candy) +
   aes(winpercent, reorder(rownames(candy),winpercent)) +
   geom_col(fill=my_cols)
```

```
ggsave("tmp.png")
```

#### Saving 5.5 x 3.5 in image

- Q17. What is the worst ranked chocolate candy? Sixlets
- Q18. What is the best ranked fruity candy? Starburst

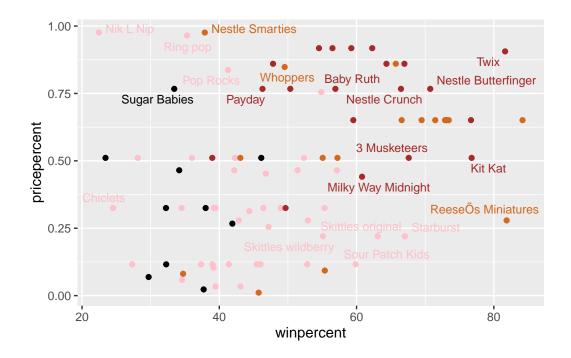

#### ##Price Percents

Q19. Which candy type is the highest ranked in terms of winpercent for the least money - i.e. offers the most bang for your buck? Reeses Minature

```
library(ggrepel)

# How about a plot of price vs win
ggplot(candy) +
   aes(winpercent, pricepercent, label=rownames(candy)) +
   geom_point(col=my_cols) +
   geom_text_repel(col=my_cols, size=3.3, max.overlaps = 5)
```

Warning: ggrepel: 65 unlabeled data points (too many overlaps). Consider increasing max.overlaps

Q20. What are the top 5 most expensive candy types in the dataset and of these which is the least popular?

```
ord <- order(candy$pricepercent, decreasing = TRUE)
head( candy[ord,c(11,12)], n=5 )</pre>
```

|                          | pricepercent | winpercent |
|--------------------------|--------------|------------|
| Nik L Nip                | 0.976        | 22.44534   |
| Nestle Smarties          | 0.976        | 37.88719   |
| Ring pop                 | 0.965        | 35.29076   |
| HersheyÕs Krackel        | 0.918        | 62.28448   |
| HersheyÕs Milk Chocolate | 0.918        | 56.49050   |

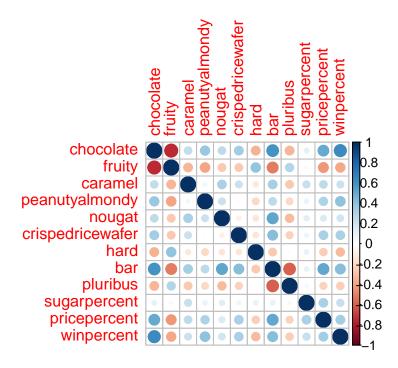

5 most expensive candies are Nik L Nip, Ring Pop, Nestle Smarties, Hershey Krackel and Hersheys Milk Chocolate. Least popular is Nik L Nip.

##Exploring Correlation Structure

```
library(corrplot)
```

#### corrplot 0.92 loaded

```
cij <- cor(candy)
corrplot(cij)</pre>
```

- Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)? 2 variables with anti correlation are chocolate and fruity.
- Q23. Similarly, what two variables are most positively correlated? 2 variables most positively correlated is chocolate and winpercent.

##Principal Component Analysis

```
pca <- prcomp(candy, scale=TRUE)
summary(pca)</pre>
```

Importance of components:

PC1 PC2 PC3 PC4 PC5 PC6 PC7

#Comparing PC1 vs PC2

```
plot(pca$x[,1:2], col=my_cols, pch=16)
```

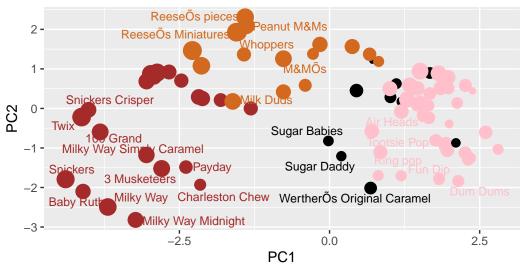

```
library(ggrepel)

p + geom_text_repel(size=3.3, col=my_cols, max.overlaps = 7) +
    theme(legend.position = "none") +
    labs(title="Halloween Candy PCA Space",
        subtitle="Colored by type: chocolate bar (dark brown), chocolate other (light brown caption="Data from 538")
```

Warning: ggrepel: 60 unlabeled data points (too many overlaps). Consider

### Halloween Candy PCA Space

Colored by type: chocolate bar (dark brown), chocolate other (light brown),

Data from 538

```
#library(plotly)
#ggplotly(p)

par(mar=c(8,4,2,2))
barplot(pca$rotation[,1], las=2, ylab="PC1 Contribution")
```

Q24. What original variables are picked up strongly by PC1 in the positive direction? Do these make sense to you? Fruity,hard, and pluribus are in a positive direction.
